Exam : **C1000-119**

Title : IBM Cloud Professional SRE v2

Version : DEMO

1.Which actions can be taken to troubleshoot a virtual machine (VM) failure on IBM Cloud? (Choose two)
A. Restart the VM and check for error logs
B. Manually delete the VM and create a new one
C. Check the resource allocation and CPU usage
D. Disable all security settings to improve performance
Answer: AC

2.In the context of recovering from failure, what is the significance of a post-mortem analysis?
A. It assigns blame to team members for the failure.
B. It identifies the root cause of the failure to prevent future occurrences.
C. It is a formality that has no real impact on future operations.
D. It focuses on external factors outside the organization's control.
Answer: B

3.Which of the following are effective strategies for troubleshooting CI/CD pipeline failures? (Choose two)
A. Reviewing logs and monitoring data for insights into the failure.
B. Ignoring intermittent failures to focus on persistent issues.
C. Isolating changes to determine the specific cause of failures.
D. Relying solely on external support forums for solutions.
Answer: AC

4.Which factors should be considered to enhance system/service reliability? (Select all that apply)
A. Deployment of updates during peak usage times to maximize impact.
B. Continuous testing and integration of new features.
C. Regularly reviewing and updating disaster recovery plans.
D. Implementing a robust user feedback loop to detect issues early.
Answer: BCD

5.What is the primary purpose of data replication in cloud environments?
A. To increase data access speed
B. To ensure data availability and durability
C. To reduce storage costs
D. To create temporary backup files
Answer: B
